DRESSER

Standard Blower and Exhaust

SRB/SRE Series

SRB blower units and SRE exhauster units Each standard packaged blower or exhauster combines a Roots blower unit supplying oil-free air with an electric motor, vee-belt drive, intake filter/silencer, filter restriction indicator, discharge silencer, non return valves and relief valves. The blower is mounted on a rigid baseplate and contained within a practical acoustic enclosure, which reduces radiated noise levels for noise sensitive locations.

The SRB range covers pressures from 300 to 1000 mbar (1.5-15kW) with inlet volumes from 50m³/h to 300m³/h. The SRE range covers 300 mbar to 500 mbar (1.5kW to 7.5kW). Pressure relief and non-return valves are supplied loose for installation into customer's pipework. Both packages have hinged access with security locks.

MRB blower units The MRB range of standard package units offer pressures from 300 mbar to 1000 mbar (7.5kW to 30kW) and inlet volumes from 400m³/h to 1400m³/h.

Each MRB package combines a Roots URAI blower unit supplying oil free air with an electric motor, vee-belt drive, intake filter/silencer, discharge silencer, filter restriction indicator, non return valve and pressure relief valve. The blower is mounted on a rigid baseplate with fork-lift slots and contained within a fan vented acoustic enclosure, which reduces radiated noise levels for noise sensitive locations.

The pressure relief valve and non-return valve are supplied loose for installation into customer's pipework. The package has hinged access with security locks.

MRE exhauster units The MRE offers vacuums from 200 mbar to 500 mbar (5.5kW to 30kW) with all the features of the MRB.

All packages comply with the EU machinery directive with regard to CE marking.

MRB/MRE Range

At the heart of the SRB/E and MRB/E Package

Reliability is at the heart of every package in the form of the DRESSER Roots Universal RAI® blower/exhauster. The URAI is designed, precision machined and built using the latest computer aided methods. This ensures close tolerances between the impellers, casing and headplates to minimise back slippage of air and improve both efficiency and reliability. The DRESSER Roots exclusive "Figure of 8" gearbox design improves oil distribution and lengthens bearing and gear life. Oversize anti-friction bearings support the shafts. On the drive end, cylindrical roller bearings carry vee-belt side loading and extend service life.

Other models available on request

Standard Blower and Exhaust

Extra Low Pulse Units The PRIME package unit range features **five** different standard designs. All PIME packages can be supplied with easy access enclosures for noise sensitive locations.

As a guide, individual package noise levels are between 70 and 85 dBA at 1 metre from the package perimeter in free-field conditions, depending on site conditions.

Please contact our sales department for noise levels at specific operating conditions or to discuss noise requirements.

All packages comply with EU machinery directive with regard to CE marking.

All PRIME units are supported by a full manufacturer's warranty and sales and service support is available from the DRESSER Roots Huddersfield facility in the UK and from our worldwide after-market support network.

All PRIME units are designed to be user friendly and to demonstrate the following key features:

- Extremely compact design
- Short installation cycle time
- Easy maintenance access
- Low installation cost
- Low operation costs

Due to the increased use of common components and a standardised design concept, the PRIME range of package units are available on short lead times.

XLP Prime Range

The Roots XLP Advantage

The XLP Whispair® blower is designed to reduce noise and power loss by utilising an exclusive wrap-around plenum and proprietary double* jet Whispair® feature to control pressure equalisation and increase reliability.

The proven design concepts of the 3 lobe impeller profile together with the double jet Whispair® feature, combine to produce such low pulsation levels that inlet and discharge silencers are no longer required to control in-pipe noise and pulsation. This in turn allows for an extremely compact and cost competitive package unit design.

* XLP N08 and N10 have a single jet design.

PRIME PACKS

Conventional Packages

In addition to the standard package units supplied in the pre-designed enclosures, conventional packages are available for all blower and vacuum pump models. A full range of ancillaries and acoustic enclosures are available.

All packages comply with EU machinery directive with regard to CE marking.

Acoustic Enclosures A range of acoustic enclosures to match the various sizes of packaged units can be supplied. These are close fitting and are constructed from a range of bolted panels which are manufactured from galvanised sheet steel lined with a layer of sound absorbent material.

Assembling the panels is extremely simple enabling the enclosure to be speedily built up on site. Access doors and sound attenuating ducts for ventilating air are incorporated. The enclosure can be made fully weather-proof if required.

Customised Units

Ancillary Equipment

Electric Motor: An electric motor of sufficient power to drive the blower/ exhauster at the specified duty is fitted.

V-Belt Drive: A wedge belt drive arrangement consisting of pulleys, taper bushes and V-belts is supplied.

Guard: A guard designed to cover the drive is fitted.

Inlet Filter / Silencer: An inlet filter combined with an absorptive or reactive type silencer is fitted to the intake of the blower.

Discharge Silencer: A specially designed silencer is fitted to the discharge of a blower or exhauster. This dissipates pulsation energy and reduces pipeline noise levels.

Filter Restriction Indicator: A restriction indicator to give visual indication of blockage of the inlet filter is fitted.

Pressure Operated Electrical Switch: A pressure or vacuum operated electrical switch designed to stop the machine in the event of an excessive pressure developing on the outlet of the blower, or vacuum at the inlet of an exhauster, can be fitted as an option.

Non-Return Valve: A non-return valve is fitted in the discharge line of a blower or in the suction line of an exhauster to prevent reversal of rotation.

Relief Valve: A relief valve is fitted in the discharge line of a blower or the suction line of an exhauster. This is capable of passing the whole of the volume delivered at the operating speed of the blower.

Flexible Connection: A flexible connection to prevent vibration and shock from reaching downstream equipment is supplied.

Anti-Vibration Mountings: Anti-Vibration mountings capable of isolating both high and low frequencies from foundations can be supplied as an option.

Pressure and Vacuum Gauges: Should a visual indication of pressure be required, pressure and vacuum gauges can be supplied as options.

Engineered Packages

DRESSER Roots offer fully engineered packaged blower units designed to meet customer requirements. Pre-assembled skid-mounted packages, with all piping, valves and instrumentation in place are produced for pressure or vacuum applications allowing for simple on-site installation.

▼
A two-stage DVJ dry vacuum pump package for non-cryogenic air separation by VSA (Vacuum Swing Adsorption).

▲
A two-stage XLP Oxygen blower package.

▲
RAM 406-G-DPJ high pressure gas blower for digester gas applications.

▼
This two-stage VJ vacuum pump package is employed on VSA (Vacuum Swing Adsorption) duty.

Customer Services

At DRESSER Roots we provide a complete range of services geared to keeping your Roots equipment operating at peak efficiency, and stopping unnecessary downtime.

Installation & Commissioning Our comprehensive aftermarket support includes installation and commissioning supervision for all packaged blower and vacuum pump units.

Repairs Blower repairs can be carried out in any of the four DRESSER Roots in-house repair facilities in the USA, UK or the Netherlands, or by one of our ten world-wide authorised service and repair facilities.

Spare Parts Spares are generally available for blowers & vacuum pumps on an ex-stock basis.

Testing All DRESSER Roots blowers and vacuum pumps are factory tested prior to shipment. Tests can include full package unit performance tests to recognised international standards.

Quality The DRESSER Roots manufacturing facilities in the USA and UK are fully ISO 9001 certified and follow Total Quality Management procedures.

▲ The new 20,000 sq. ft. Roots service centre in Houston, Texas.

▲ Blower repair work.

▲ A new variable speed model XLP test rig.
